

ABSTRACT

In order to insert a prefabricated electric cable with a connector insert already mounted thereon into a plug connector housing with a cable connection piece, the invention proposes to realize the plug connector housing in the form of two interconnectable housing halves, wherein the connector insert with the cable connected thereto is installed into the plug connector housing.

Slotted sealing elements as well as two joinable screw elements that are centrally partitioned in the longitudinal direction are provided in order to seal and relieve the strain on the cable that protrudes from the cable connection piece. The sealing elements and the screw elements are placed around the cable and connected such that a screwed cable gland is formed.
